

**Figure S2: EV miRNA level expression as copies per vesicle and correlation with HIV-relevant clinical parameters**

Copy number of each molecule per large and small vesicle in ml of plasma is expressed for each subject (n = 25); **(A)** miR-92 and **(B)** miR-223. Box and whisker plots show the overall ranges and medians.

Spearman tests were used to evaluate correlations between viral load and miR-223 copies per large vesicle **(C)** in ART-naive patients.
